## 1.0 NEAR-FACILITY ENVIRONMENTAL MONITORING AT HANFORD

Near-facility environmental monitoring is defined as monitoring near facilities that have the potential to discharge or have discharged, stored, or disposed of radioactive or hazardous materials. Monitoring locations are associated with nuclear facilities such as the Canister Storage Building (CSB); inactive nuclear facilities such as N Reactor, the Plutonium-Uranium Extraction (PUREX) Facility, and the Plutonium Finishing Plant (PFP); and waste storage or disposal facilities such as burial grounds, cribs, ditches, ponds, tank farms, and trenches.

Much of the monitoring consists of collecting and analyzing environmental samples and methodically surveying areas near facilities. The program is also designed to evaluate acquired analytical data, determine the effectiveness of facility effluent monitoring and controls, assess the adequacy of containment at waste disposal units, and detect and monitor unusual conditions. The program implements applicable portions of U.S. Department of Energy (DOE) Orders 435.1 (DOE 2001), 450.1A (DOE 2008), and 5400.5 (DOE 1993); DOE Manual 231.1-1A (DOE 2007), *Environment, Safety, and Health Reporting Manual; Washington Administrative Code* (WAC) 246-247; Title 40, *Code of Federal Regulations* (CFR) Part 61 (40 CFR 61), Subpart H; and 10 CFR 835.

Several types of environmental media are sampled near facilities to monitor waste management and environmental restoration activities, and to evaluate the effectiveness of effluent treatment and control practices. Routine sampling and monitoring includes ambient air, soil, vegetation, and external radiation. The parameters typically monitored are radionuclide concentrations and radiation fields. Sampling methods are discussed in detail in Mission Support Alliance, LLC (MSA), MSC-PRO-46517, *Near-Facility Environmental Monitoring*, (MSA 2010).

Samples are collected from known or expected effluent pathways. These pathways are generally downwind of potential or actual airborne releases and down gradient of past liquid discharges. Table 1-1 shows the type and location of routine near-facility monitoring (NFM) samples collected in 2009.

Table 1-1. Near-Facility Routine Environmental Monitoring Samples and Locations, 2009.

Sample Type	Number of Sample Locations	Operational Area								
		100-K	100-N	100-D	100-H	200 East	200 West	300/ 400	600	ERDF <sup>(a)</sup>
Air	84	10	3	4	4	21	24	7	8	3
Soil	73	0	0	0	4	13	26	14	15	1
Vegetation	58	0	3	0	0	8	18	14	15	0
External Radiation	119	18	5	0	0	43	24	25	1	3

(a) Environmental Restoration Disposal Facility in the 200 West Area.

This Appendix contains brief discussions, specific sampling location information, and complete analytical data results for the various near-facility environmental monitoring efforts for 2009. Detailed discussions and summarized analytical results are provided in PNNL-19455, *Hanford Site Environmental Report for Calendar Year 2009* (PNNL 2010a)

## **1.1 AIR MONITORING**

Near-facility air sampling monitors the effectiveness of waste management and environmental remediation controls and effluent treatment systems in reducing effluents and emissions. These air samplers also monitor diffuse source emissions.

Ambient air monitoring is conducted to determine baseline concentrations of radionuclides in the operations areas, assess the impact of operations on the local environment, and monitor diffuse and fugitive emissions from sources located within the operations area. These measurements also provide an indication of the Plateau Remediation Contract (PRC), River Protection Project (RPP), and River Corridor Closure (RCC) Project managed facilities' performance and are used to demonstrate compliance with environmental protection criteria.

In 2009, air radioactivity was sampled by a network of continuously operating samplers at 84 locations. Location-specific maps and monitoring results are provided in Section 2.0, "Ambient Air Monitoring."

## **1.2 SOIL SAMPLING**

Soil samples were collected on or adjacent to waste disposal units and from locations downwind and near or within the boundaries of the operating facilities. Soil samples were collected to detect potential migration and deposition of facility effluents. Migration of radionuclides can occur as the result of resuspension from radioactively contaminated surface areas or intrusion by animals.

Radiological analyses of soil samples included strontium-90, plutonium-239/240, isotopic uranium, and gamma-emitting radionuclides. Location-specific maps and the analytical results are presented in Section 3.0, "Soil Monitoring."

## **1.3 VEGETATION SAMPLING**

Vegetation samples were collected on or adjacent to waste disposal units and from locations downwind and near or within the boundaries of the operating facilities. Vegetation samples were collected to detect potential migration of facility effluents. Migration of radionuclides into vegetation can occur primarily as the result of absorption by the roots growing on or near underground and surface water disposal units.

Radiological analyses of vegetation samples included strontium-90, plutonium-239/240, isotopic uranium, and gamma-emitting radionuclides. Location-specific maps and the analytical results are presented in Section 4.0, “Vegetation Monitoring.”

## **1.4 EXTERNAL RADIATION**

External radiation levels were monitored near facilities and waste handling, storage, and disposal sites to measure, assess, and control the impacts of operations. Thermoluminescent dosimeters (TLDs) are used at numerous fixed locations to gather dose rate information over extended periods of time. TLD results can be used individually or averaged to determine dose rates in a given area for a particular sampling period.

Environmental dosimeters measure dose rates from all types of external radiation sources, including cosmic radiation, naturally occurring radioactivity in air and soil, and fallout from nuclear weapons testing, as well as any contribution from Hanford Site activities. During any year, changes in soil moisture and snow cover can cause external radiation levels to vary from 15% to 25% at any given location. The results are reported in units of millirems per year (mrem/yr). Individual TLD results and their locations are provided in Section 5.0, “External Radiation.”

## **1.5 RADIOLOGICAL SURVEYS**

Waste disposal sites and the surrounding terrain are surveyed to detect and characterize radioactive surface contamination. Routine radiological surveys are conducted across the surfaces of underground radioactive material areas and along the perimeters of contamination areas. Locations include cribs, trenches, retention basins, ponds, ditches, solid waste disposal sites, unplanned release sites, tank farm perimeters, stabilized waste disposal sites, roads, and firebreaks in and around the Site operational areas. A discussion and survey location maps are provided in Section 6.0, “Radiological Surveys.”

In 2009, the Hanford Site had approximately 3,581 ha (8,849 acres) of posted outdoor surface contamination, and 578 ha (1,429 acres) of posted underground radioactive material, not including the production facilities (e.g., PUREX, T-Plant, etc.). The total area of surface contamination was approximately six times larger than the area of underground radioactive material.

## **1.6 INVESTIGATIVE SAMPLING**

Investigative sampling was conducted in the operations areas to confirm the absence or presence of radioactive and/or hazardous contaminants. Investigative sampling took place near facilities, such as storage and disposal sites, for at least one of the following reasons:

- To follow up radiological surface surveys that had indicated radioactive contamination was present.

- To conduct preoperational surveys to characterize the radiological/hazardous conditions at a site prior to facility construction, operation, or ultimate remediation.
- To determine if biotic intrusion (e.g., animal burrows or deep-rooted vegetation) has created a potential for contaminants to spread.
- To determine the integrity of waste containment systems.

Generally, the predominant radionuclides detected during these efforts were activation and fission products in the 100 Areas, fission products in the 200 Areas, and uranium in the 300 Area. Hazardous chemicals generally have not been identified above background levels in preoperational environmental monitoring samples. Complete results and general discussion of special characterization samples analyzed in 2009, are provided in Section 7.0, “Investigative Sampling.”

## **2.0 AMBIENT AIR MONITORING**

Air samplers are located primarily at or near (within approximately 500 m [1,600 ft]) sites and/or facilities having the potential for, or history of, environmental releases, with emphasis on potential source terms as well as prevailing wind direction. Meteorological conditions are monitored continuously by the Pacific Northwest National Laboratory (PNNL) meteorology stations, which are strategically positioned in and around the Hanford Site.

A network of continuously operating samplers at 84 near-facility monitoring locations sampled radioactivity in air during 2009. Some air sampling stations provided monitoring for more than one project (Table 2-1). Data from several PNNL ambient air monitoring stations were utilized in 2009 to provide additional air monitoring information for several RCC remediation projects. The RCC projects and the associated PNNL stations are listed in Table 2-2. The 2009, PNNL air monitoring results can be found in PNNL-19455, Appendix 1.

Near-facility air monitoring location maps are provided in Figures 2-1 through 2-10. Historical air sampling results for selected radionuclides for the 100-K, 100-N, 200 and 300 Areas are represented in graph form in Figures 2-11 through 2-22.

A summary of near-facility ambient air sampling results collected during 2009 is presented in Table 2-3. The 2009 composited, sampler-specific monitoring results are provided in Table 2-4. Additional discussion of the 2009 air sampling results can be found in Section 8.2 of PNNL-19455.

The Hanford Site Air Operating permit (Federal Facility License FF-01) requires regulatory notification for composite [isotopic] air sample results that exceed 10% of the U.S. Environmental Protection Agency's Table 2 (40 CFR 61, Appendix E, Table 2) values. During 2009, the following notifications were submitted to the Washington State Department of Health (WDOH):

### First Half of 2009

- NFM station N165 (200 West Area): Plutonium-239/240

One suspected source of this elevated result is the nearby, retired 216-ZP-1C crib/trench. This facility received liquid waste from PFP until 1995. In November 2002, the building that had provided electrical service to N165 was demolished and the station was relocated to the present location. Historical plutonium-239/240 results observed at monitoring station N165 are included in Figure 2-22.

- NFM station N987 (200 West Area, East of TX/TY Tank Farm): Plutonium-239/240

No facility/project activity was determined to be the attributable cause of this elevated result. Review of the biweekly air sample results obtained during the composite period revealed that there were no statistically elevated total alpha/beta results during the period.

- NFM station N401 (100-K East Area): Cs-137
- NFM station N402 (100-K East Area): Am-241, Cs-137, Pu-239/240 and Sr-90
- NFM station N403 (100-K East Area): Am-241, Cs-137, Pu-239/240 and Sr-90
- NFM station N404 (100-K East Area): Cs-137

Demolition of the K-East Basin and the removal of the contaminated soil that had been underneath it were ongoing during 2009 and were the probable cause of these elevated results.

#### Second Half of 2009

- NFM station N019 (200 East Area, near B-Plant): Cs-137

While no facility/project activity was determined to be a direct cause of this elevated result, it may have resulted from the B Plant Canyon ventilation system being out of service between August 2009 and March 2010. Review of the biweekly air sample results obtained during the composite period revealed that there were no statistically elevated total alpha/beta results during the period.

- NFM station N401 (100-K East Area): Am-241, Cs-137, Pu-239/240 and Sr-90
- NFM station N402 (100-K East Area): Am-241, Cs-137, Pu-239/240 and Sr-90
- NFM station N403 (100-K East Area): Am-241, Cs-137, Pu-239/240 and Sr-90
- NFM station N404 (100-K East Area): Am-241, Cs-137, Pu-239/240 and Sr-90

Demolition of the K-East Basin and the removal of the contaminated soil that had been underneath it were ongoing during 2009 and were the probable cause of these elevated results.

- NFM station N477 (100-K West Area): Cs-137
- NFM station N478 (100-K West Area): Cs-137
- NFM station N479 (100-K West Area): Cs-137

Demolition activities at the K-East Basin and the removal and transport of the resulting contaminated soil/debris were the probable causes of the elevated results at K-West.

Near-facility environmental air samplers operate at a flow rate of 0.057 m<sup>3</sup>/min (2 ft<sup>3</sup>/min), drawing a sample through a 47 mm (2-in.), open-faced filter about 2 m (6 ft) aboveground. All sample filters are exchanged biweekly, held one week (to allow for decay of short-lived natural radioactivity), and then sent to the analytical laboratory for initial analysis of total alpha and total beta activity. These initial analyses serve as an indicator of potential environmental problems.

Depending on project/facility requirements, the filters were stored until the end of either a three or six-month sample period, then segregated and composited by sample location for specific radionuclide analysis as shown in Table 2-1. Segregating and compositing air filters by site provides a larger sample size and, thus, a more sensitive and accurate measurement of the concentration of airborne radionuclides.

All air sampling results are compared to DOE derived concentration guides (DCG) and/or U.S. Environmental Protection Agency concentration levels and are also statistically evaluated. To help assess the impact of Site operations, monitoring results are compared to the results obtained from the distant community of Yakima as reported by the PNNL Site Environmental Surveillance Program, and to data acquired from collocated sampling locations managed by NFM, PNNL and WDOH. Collocated sampling results are used for comparability and precision of data.

Table 2-1. Near-Facility Air Sampling Locations and Analyses, 2009.

### **3.0 SOIL MONITORING**

The radionuclide content of soil was measured to evaluate long-term trends in environmental accumulation of radioactivity in the 100, 200/600, and 300/400 Areas. Soil samples were collected on or near facilities that store, handle, or dispose of radioactive waste. The number of soil samples collected in 2009 and their locations are shown in Table 3-1.

Table 3-1. Soil Samples Collected During 2009.

<b>Number of Samples</b>	<b>Operational Area</b>						
	<b>100-H</b>	<b>200 West<sup>(a)</sup></b>	<b>200 East<sup>(a)</sup></b>	<b>600<sup>(a)</sup></b>	<b>300<sup>(a)</sup></b>	<b>400</b>	<b>ERDF<sup>(b)</sup></b>
81	4	27	14	18	16	1	1

(a) Number of samples includes one or more Replicate Samples.

(b) Environmental Restoration Disposal Facility in the 200 West Area.

Soil sampling locations are illustrated in Figures 3-1 through 3-6. Radionuclide analyses indicated that strontium-90, cesium-137, plutonium-239/240, and uranium were detectable in soil samples in 2009. Generally, the predominant radionuclides observed were activation and fission products in the 100 Areas, fission products in the 200 Areas, and uranium in the 300 Area.

A summary of near-facility soil sampling results for selected radionuclides collected during 2009 is presented in Table 3-2. Historical soil sampling results for the 100, 200/600, and 300/400 Areas are displayed in Table 3-3. The 2009 soil sampling results for all areas are provided in Table 3-4.

One sample in the 300 Area showed an unusually elevated strontium-90 result. This elevated result was found in one sample in a single occurrence. Cleanup efforts continue in the 300 Area, possibly attributing to the elevated results.

Additional discussion of the 2009 soil sampling results can be found in Section 8.9.1 of PNNL-19455.

## 4.0 VEGETATION MONITORING

The radionuclide content of vegetation was measured to evaluate long-term trends in environmental accumulation of radioactivity in the 100, 200/600, and 300/400 Areas. Vegetation samples were collected on or near facilities that store, handle, or dispose of radioactive waste. The number of vegetation samples collected in 2009 and their locations are shown in Table 4-1.

Table 4-1. Number and Locations of Vegetation Samples Collected Near Hanford Facilities and Operations in 2009.

Number of Samples	Operational Area					
	100-N	200-East	200-West <sup>(a)</sup>	300 <sup>(a)</sup>	400	600 <sup>(a)</sup>
64	3	8	19	16	1	17

(a) Number of samples includes one or more Replicate Samples.

Vegetation sampling locations are illustrated in Figures 4-1 through 4-6. Radionuclide analyses indicated that strontium-90, cesium-137, plutonium-238, plutonium-239/240, and uranium were detectable in vegetation samples in 2009. Historically, the predominant radionuclides observed in vegetation samples were activation and fission products in the 100 Areas, fission products in the 200 Areas, and uranium in the 300 Area.

A summary of near-facility vegetation sampling results for selected radionuclides collected during 2009 is presented in Table 4-2. Historical vegetation sampling results for the 100-N, 200/600, and 300/400 Areas are displayed in Table 4-3. The 2009 vegetation sampling results for all areas are provided in Table 4-4.

Strontium-90 in vegetation samples for this report period showed a frequent occurrence of negative (i.e., less than zero) concentrations. This was primarily due to changes in laboratory background correction calculations that were implemented during 2003. Both historical and current values are within accepted statistical ranges as evidenced by laboratory quality assurance (QA) and performance evaluation programs.

Additional discussion of the 2009 vegetation results can be found in Section 8.10.2 of PNNL-19455.

## 5.0 EXTERNAL RADIATION

External radiation fields were monitored near facilities and waste handling, storage, and disposal sites to measure and assess the impacts of operations. TLD results were used at numerous fixed locations to gather dose rate information over extended periods of time, typically three months.

In 2009, there were 119 TLD locations collecting external radiation information. The number of TLD locations in each operational area and a summary table comparing the 2008 and 2009 TLD results are provided in Table 5-1. Additional discussion of external radiation monitoring conducted near facilities and operations during 2009 can be found in Section 8.13 of PNNL-19455 (PNNL 2010a).

Table 5-1. Thermoluminescent Dosimeter Results (mrem/yr)<sup>(a)</sup> for 2008 and 2009.

Hanford Site Locations	Number of Dosimeters	2008		2009		% Change <sup>(e)</sup>
		Maximum <sup>(b)</sup>	Average <sup>(c,d)</sup>	Maximum <sup>(b)</sup>	Average <sup>(c,d)</sup>	
100-K	14	574 ± 42	192 ± 255	1,525 ± 2,814	278 ± 735	45%
100-N	5	106 ± 9	88 ± 25	133 ± 64	96 ± 47	10%
200-East	42	280 ± 37	103 ± 80	285 ± 55	102 ± 78	0%
200-West	24	259 ± 135	105 ± 77	189 ± 21	99 ± 50	-5%
200-North (212-R) <sup>(f)</sup>	1	1,663 ± 250	1,647 ± 26	1,697 ± 254	1,552 ± 323	-6%
300 Area	8	103 ± 7	83 ± 17	101 ± 9	82 ± 17	<1%
300 TEDF	6	83 ± 7	81 ± 3	84 ± 13	80 ± 5	<1%
300-FF-2	4	81 ± 8	79 ± 4	81 ± 12	80 ± 10	<1%
400 Area	7	94 ± 9	81 ± 12	92 ± 8	79 ± 13	-2%
CVDF	4	302 ± 18	151 ± 203	243 ± 316	138 ± 149	-8%
ERDF	3	80 ± 10	79 ± 4	91 ± 23	85 ± 12	8%
IDF <sup>(f)</sup>	1	87 ± 13	85 ± 5	93 ± 14	88 ± 7	4%

(a) To convert to international metric system units, multiply mrem/yr by 0.01 to obtain mSv/yr.

(b) Maximum values are ± analytical uncertainty.

(c) ± 2 standard deviations.

(d) Each dosimeter is collected and read quarterly.

(e) Numbers indicate a decrease (-) or increase from the 2008 mean.

(f) Maximum value represents highest quarterly value ± analytical uncertainty.

CVDF = Cold Vacuum Drying Facility (100 K Area).

ERDF = Environmental Restoration Disposal Facility (200 West Area).

IDF = Integrated Disposal Facility (200 East Area).

TEDF = 300 Area Treated Effluent Disposal Facility.

Observations in dose rate monitoring during 2009 included the following:

- The external radiation levels measured at most of the operational areas during 2009 were  $\pm$  10% of 2008 levels.
- Cleanup activities for the K Basins Closure project were ongoing during 2009. Removal of potentially contaminated soil beneath the K East Basin attributed to noticeable increases in average dose rates at all TLD locations in the immediate vicinity of the cleanup work. Dose-rate levels measured in 2009 at monitoring stations in the K West area and the Cold Vacuum Drying Facility were, conversely, noticeably decreased compared to 2008 levels. Quarterly dose rate levels for each of the facilities/projects at 100-K Area are presented in graph form in Figure 5-1.
- Dose rates observed at the N Springs shoreline TLD location were approximately 2% lower in 2009 than in 2008. Figure 5-2 provides historical trend plots of quarterly dose rates at the 116-N-1, 100-N Area and N-Springs monitoring locations.
- Dose rates observed in the 200-East and 200-West Areas during 2009 were comparable to levels measured in 2008. Dose rates at the 212-R Facility, while again in 2009 the highest on site, were approximately 6% lower than those measured during 2008. Figure 5-3 provides historical trend plots of quarterly dose rate levels for each of the 200 Area operational areas.
- Dose rates measured during 2009 at ERDF were approximately 8% higher than 2008 levels.
- Dose rates measured at the 300 Area Treated Effluent Disposal Facility (TEDF), 300-FF-2 Field Remediation project, and in the 400 Area were consistent with previous years' measurements. Figure 5-4 provides historical trend plots of quarterly dose rate levels for each of these operational areas.
- Maps showing the 2009 TLD locations are provided in Figures 5-5 through 5-11 and individual 2009 TLD results are provided in Table 5-2.

## **6.0 RADIOLOGICAL SURVEYS**

In 2009, there were approximately 3,581 hectares (8,849 acres) of posted outdoor contamination areas and 578 hectares (1,429 acres) of posted underground radioactive materials areas at the Hanford Site. During 2009, several waste sites in the 100 Areas (4 hectares [10 acres]) and two waste sites in the 600 Area (4 hectares [10 acres]) were remediated and released from posting. A listing of these waste sites is provided in Table 6-1.

Posted contamination areas continually vary in number and size from year to year because of ongoing efforts to clean, stabilize, and remediate areas of known contamination. In conjunction, new areas of contamination are also being identified throughout the year. Survey locations, typically associated with cribs, trenches, burial grounds, tank farms, and covered ponds and ditches, are illustrated in Figures 6-1 through 6-10.

It was estimated that the external dose rate at 80% of the identified outdoor contamination areas was less than 1 mrem/hr, although direct dose rate readings from isolated radioactive specks (a diameter less than 0.6 cm [0.25 in.]) could have been considerably higher. Contamination levels of this magnitude did not significantly add to dose rates for the public or Hanford Site workers in 2009.

Table 6-1. Waste Sites Remediated and Released From Posting During 2009.

## 7.0 INVESTIGATIVE SAMPLING

Investigative samples were typically collected where known or suspected radioactive contamination was present, or to verify radiological conditions at project sites. Though several soil, vegetation, and animal samples were collected during 2009, none of these were submitted to the laboratory for analysis. The numbers of soil, vegetation, and animal radiological contamination instances during 2009 are listed chronologically in Table 7-1 and historic instances of each since 1994 are represented in graph form in Figure 7-1.

Table 7-1. Contamination Instances, 2009. (Sheet 1 of 4)

<b>SAMPLE MATRIX</b>	<b>LOCATION</b>	<b>FIELD READING</b> <b>Beta/Gamma</b>	<b>DATE</b>
Tumbleweeds (~70)	200-E Perimeter Fence North of 218-E-12B	>1,000,000 dpm/100cm <sup>2</sup>	01/07/09

Figure 7-1. Contamination Instances and Types Since 1994.

## 7.1 SOIL

In 2009, there were 27 instances of radiological contamination in which soil was identified as the carrier. Of these, 19 were identified as specks, or soil specks. Often, specks observed under high magnification are found to be small pieces of decomposed vegetation, most often tumbleweeds. External radioactivity levels ranged from approximately 3,000 disintegrations per minute (dpm)/100 cm<sup>2</sup> to more than 6,000,000 dpm/100 cm<sup>2</sup>. Contaminated areas were radiologically posted or cleaned up. The number of contamination

incidents and the range of radiation levels observed in 2009 were generally within historical ranges.

## **7.2 VEGETATION**

In 2009, there were 109 instances in which vegetation was identified as the carrier of radiological contamination. Twenty two instances of contaminated vegetation had field readings in excess of 1,000,000 dpm/100 cm<sup>2</sup>. The radioactivity levels were all within historical ranges.

Though the number of contaminated vegetation incidents in 2009 decreased compared to the number of incidents in 2008, it was the second highest number reported to date. Nearly all of the incidents in both years involved tumbleweeds, whose continued presence can be attributed to favorable growing conditions (moisture), resistance to the herbicide that had been used to control tumbleweed populations, and inconsistent vegetation control and clean up. Discussion of Vegetation Control activities taken in 2009 can be found in Section 8.10.4 of PNNL-19455 (PNNL 2010a).

## **7.3 ANIMALS**

In 2009, 33 instances of contaminated animals or animal-related contamination were identified. Three animal-related samples collected in the 200 Areas exhibited field readings in excess of 1,000,000 dpm/100 cm<sup>2</sup>.

Animals were collected either as part of an integrated pest management program or as a result of radiological surveys finding contaminated wildlife-related material (e.g., feces, nests, etc.). Animals were collected directly from or near facilities in an effort to monitor and track effectiveness of preventive measures designed to deter animal intrusion. For 2009, the number of animals found to be contaminated with radioactivity and the range of radionuclide concentrations were within historical ranges.

## **7.4 SPECIAL CHARACTERIZATION SAMPLING**

As a follow-up to the 100-K Area preoperational sampling conducted in 1999, seven soil and five vegetation special characterization samples were collected at the same locations (see Figure 7-2) in 2009 and were analyzed at the Waste Sampling and Characterization Facility (WSCF). A comparison of the analytical results for selected radionuclides from both of these sampling events is provided in Table 7-2 and 7-3.

Figure 7-2. 100-K Sampling Areas.

## **8.0 QUALITY ASSURANCE**

Quality assurance may be defined as the actions necessary to provide confidence that an item, process, or program meets or exceeds the user's requirements and expectations. The near-facility environmental monitoring QA program consists of procedures and guides to demonstrate that environmental monitoring techniques and analyses are performed within established limits of acceptance. The near-facility environmental monitoring QA program and its objectives are documented in MSC-23333, *Environmental Quality Assurance Program Plan* (MSA 2010).

Written operating procedures are an integral part of near-facility environmental monitoring QA. Procedures for field operations are provided in MSC-PRO-46517 (MSA 2010). This section briefly describes the essential components of the near-facility environmental monitoring QA program.

### **8.1 DOCUMENTATION**

Record keeping is a vital part of any environmental monitoring program. Maintenance of environmental data is important from a QA standpoint, from a regulatory standpoint, and for trend analyses and optimization of environmental monitoring procedures. Each phase of near-facility environmental monitoring is documented. This documentation includes environmental sample logbooks, quarterly reports, annual reports, and occurrence reports.

### **8.2 SAMPLE REPLICATION**

The quality of sample collection methods and strategies is assessed by replicating the original samples and the statistical evaluation of them. Field replicates were collected during 2009 for ambient air, soil, and vegetation samples. Air sample replicate results were 97%, soil replicate results 95%, and vegetation replicate results 100%, the same as the original results (see Table 8-1).

Table 8-1. Summary of Field Replicate Results for 2009.

Medium	Radionuclide	Number of Results		
		Compared	In Agreement	% Agreement
Air	<sup>60</sup> Co	2	2	100

	<sup>238</sup> Pu	6	6	100
	<sup>239/240</sup> Pu	6	6	100
	Totals:	108	108	100%

Sampling methods and strategies were considered acceptable if, for a given sample medium, the overall agreement of all isotopic comparisons made between “original” and “replicate” samples were:

- Equal to or greater than 75% for air samples
- Equal to or greater than 50% for soil and vegetation samples.

The concentrations of a sample and its replicate were considered to be “in close agreement” (meaning the concentrations are, for all practical purposes, identical) if either of the following applies:

- Each concentration falls within the error range of the other; or
- Both the concentration of the sample and its replicate are “essentially zero.”

The concentrations of a sample and its replicate were considered to be “in agreement” (meaning the concentrations are close to the same value) if one of the following applies:

- On a plot, the uncertainty error bars of the sample and its replicate overlap; or
- The lower uncertainty values of both the sample and its replicate extend below the (contractual) minimum detectable concentration; or
- The relative percent difference was <30% or the percent significant difference was <15%.

### **8.3 DATA ANALYSIS**

Environmental data are reviewed to determine compliance with applicable federal and company guides. The data are analyzed both graphically and by standard statistical tests to determine trends and impacts on the environment. Newly acquired data are compared with historical data and natural background levels. Routine environmental data are stored on both magnetic media (i.e., in a computer environment) and hardcopy printouts.

### **8.4 TRAINING**

To ensure quality and consistency in sample collection and handling, all personnel performing such work received formal training. All radiological control technicians are required to complete a certification program. In addition, those radiological control technicians assigned to environmental monitoring receive special classroom orientation and on-the-job training by experienced personnel. Site Effluent & Near-Facility Monitoring personnel, in addition to their formal training received while obtaining professional degrees, have received training in courses taught through Washington State University, the Harvard School of Public Health, and various other institutions.

## **8.5 SAMPLE FREQUENCY**

1. Ambient air sample filters are collected biweekly.
2. Radiological surveys of roads are performed quarterly, bimonthly, or annually.
3. The TLDs are exchanged quarterly.
4. Radiological surveys of waste sites are performed quarterly, semiannually, or annually depending on the operating status, condition, and history of the site.
5. Soil and vegetation are collected annually.

## **8.6 ANALYTICAL PROCEDURES**

Three laboratories provided routine analytical support to the near-facility environmental monitoring: PNNL, WSCF, and the 222-S Analytical Laboratory. Samples are processed and/or analyzed in accordance with prescribed procedures and quality control guides that are described briefly in the following paragraphs.

### **8.6.1 Pacific Northwest National Laboratory Radiation Standards and Engineering**

**8.6.1.1 Thermoluminescent Dosimeters.** External radiation levels are measured using TLDs. The Hanford Site uses the Harshaw 8807 dosimeter and the Harshaw 8800 reader. The TLDs are calibrated, packaged, and read by the PNNL Radiation Calibration Laboratory, Radiation Standards and Engineering Department. All TLD work is performed in accordance with formal, written procedures.

### **8.6.2 Waste Sampling and Characterization Facility and 222-S Analytical Laboratory**

The WSCF and 222-S laboratories provide analytical support to near-facility environmental monitoring. Formal, written laboratory procedures are used in analyzing samples. The WSCF is used for the samples containing typical environmental levels of radioactivity. The WSCF also participates in a QA Task Force intercomparison program coordinated by the Radiation Protection Division of the WDOH. The 222-S laboratory is typically used for preparation of selected samples and/or analyses of samples containing higher-than-normal levels of radioactivity. Additional discussion regarding the WSCF QA program can be found in Section 8.17 of PNNL-19455 (PNNL 2010a).

## 9.0 GLOSSARY

**Accessible Soils:** Hanford soils that are not behind security fences must meet a 10 mrem/yr effective dose equivalent (EDE) limit from Hanford Site operations to the most exposed member of the public.

**Average Soil Contamination:** Contamination generally dispersed through the soil. Numerically, the radioactivity content averaged over a suitable mass of soil.

**Background Radiation:** Refers to regional levels of radioactivity produced by sources other than those of specific interest (e.g., the nuclear activities at the Hanford Site).

**Becquerel (Bq):** The standard international unit of radioactivity. One Becquerel is one disintegration per second or:  $Bq = 2.7 \times 10^{-11} Ci$ .

**Biological Transport:** Means of biological transport may include one or more of the following processes:

- Movement of subsurface radioactivity to the surface by physiological vegetative processes.
- Dispersion of such vegetation by the wind.
- Contaminated urine and feces deposited by animals that have gained access to and ingested radioactive materials.
- Contaminated animals themselves that have ingested radioactive materials directly or ingested other contaminated animals or plants.
- Physical displacement of radioactive materials by burrowing animals.
- Nests built using contaminated materials.

**Biota:** The plant and animal life of a specific region.

**Burial Ground:** A land area specifically designated to receive contaminated solid or solidified liquid waste packages and equipment. The contaminated articles are usually placed in trenches and covered with overburden.

**Calibration:** Determining the deviation of an instrument from a standard traceable to the National Bureau of Standards or other recognized agency and reporting the deviations and/or eliminating them by adjustment.

**Chemical Processing:** Chemical treatment of material to separate desired components selectively. At the Hanford Site, plutonium, uranium, and fission products were chemically separated from irradiated fuels.

**Committed Dose Equivalent:** The predicted total dose equivalent to a tissue or organ over a 50-year period after a known intake of a radionuclide into the body. It does not include contributions from external dose. Expressed in units of rem (or sievert).

**Committed Effective Dose Equivalent:** The sum of the committed dose equivalents to various tissues in the body, each multiplied by the appropriate weighing factor. Expressed in units of rem (or sievert).

**Composite Sample:** A number of samples initially collected from a sample medium and combined into a single sample; this sample is analyzed for the contaminants of concern.

**Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA):** Commonly known as "Superfund," CERCLA was enacted to respond to uncontrolled releases of hazardous substances to the environment, primarily at inactive sites that were not adequately addressed by the *Resource Conservation and Recovery Act of 1976* (RCRA). CERCLA also applies to actively managed facilities and any onshore or offshore facility.

**Controlled Area:** An area where access is controlled to protect individuals from exposure to radiation and/or radioactive materials.

**Contamination Area:** Any area where contamination levels are greater than the values specified in Chapter 2, Table 2-2 of MSC-5173, *MSC Radiological Control Manual* (MSA 2010) but less than or equal to 100 times those values.

**Crib:** An underground structure designed to receive liquid waste that percolates into the soil directly or percolates into the soil after having traveled through a connected tile field.

**Decommissioning:** Actions taken to reduce the potential health and safety impacts of DOE controlled contaminated facilities. Actions could include stabilizing, reducing, or removing radioactivity or demolishing the contaminated facilities.

**Decontamination:** The removal of radioactive or hazardous contamination from facilities, equipment, or soils by washing, heating, chemical or electrochemical treating, mechanical cleaning, or other techniques.

**Derived Concentration Guide for Public Exposure (DCG-Public):** The concentration of a radionuclide in air or water that, under conditions of continuous exposure for one year by one exposure mode (e.g., ingestion of water, submersion in air, or inhalation of air), would result in an EDE equal to the annual dose limit applicable to the group exposed. For exposure of the public, the DCG is the radionuclide concentration in air or water that would result in an EDE of 100 mrem (1 mSv) to a person having the characteristics of the reference man.

**Diffuse Source:** A source or sources of radioactive or chemical contaminants released into the environment that do not have a defined point or origin of release (a nonpoint source).

**Disposal Facility:** Any facility or part of a facility where hazardous and/or radioactive waste is intentionally placed or where any land or water wastes will remain after closure.

**Ditch:** An open surface site for transport of liquid wastes to a pond or trench structure designed for percolation.

**Ecology:** State of Washington, Department of Ecology.

**Effective Dose Equivalent (EDE):** The summation of the products of the dose equivalent received by specified tissues of the body and a tissue-specific weighing factor. This sum is a risk-equivalent value and can be used to estimate the health-effects risk of the exposed individual. The tissue-specific weighing factor represents the fraction of the total health risk resulting from uniform whole-body irradiation that would be contributed by that particular tissue. The EDE includes the committed EDE from internal deposition of radionuclides and the EDE caused by penetrating radiation from sources outside the body. EDE is expressed in units of rem (or sievert).

**Effluent:** An airborne or liquid discharge from a facility after all engineered waste treatment and effluent controls have been performed. The term includes onsite discharges to the atmosphere, lagoons, ponds, cribs, injection wells, French drains, or ditches. The term does not include solid waste stored or removed for disposal or waste that is contained in retention basins or tanks before treatment and/or disposal.

**Environmental Monitoring Plan:** A two-part document prepared for each site, facility, or process that uses, generates, releases, or manages significant pollutants or hazardous materials.

**External Radiation:** Radiation originating from a source outside the body.

**Facility:** A processing plant, tank farm, shop, laboratory, powerhouse, or laundry. Including all contiguous land and structures, other appurtenances, and improvements on land used for recycling, reusing, reclaiming, transferring, storing, and treating of dangerous waste (including treatment, storage, and disposal sites as well as groundwater wells). (40 CFR 264, "Standards for Owners and Operators of Hazardous Waste Treatment Storage and Disposal Facilities," and WAC 173-303-040.)

**Facility-Specific Environmental Monitoring:** Routine environmental monitoring of all environmental media (air, biota, etc.) around facility perimeters.

**Field Blank:** Aliquots of analyte-free water or solvents brought to the field in sealed containers and transported to the laboratory with the sample container. Field blanks include trip blanks and equipment blanks.

**Field Duplicate:** Field duplicates are collected at specified frequencies and are used to document precision. The field duplicate precision depends on the variance of waste composition, sampling techniques, and analytical technique.

**Fugitive Emissions:** Material that is generated incidental to an operation, process, or activity and that is released or dispersed into the open air. Fugitive emissions occur via pathways that do not allow routine measurement at the point of release.

**Grab Sample:** A single sample removed from a sample medium over a short time interval.

**High-Level Nuclear Waste:** Spent nuclear fuel or radioactive waste resulting directly from the dissolution and reprocessing of spent nuclear fuel. Secondary waste streams resulting from the dissolution and reprocessing of spent nuclear fuel are not considered high-level waste.

**Inaccessible Soils:** Areas from which the general public is excluded (by fences, posting, patrols, or distance), but that are still subject to meteorological effects, are subject to a 10 mrem/yr operational EDE limit.

**Inactive Crib:** A crib that has been designated as permanently out of service.

**Inactive Radioactive Waste Site:** Any waste site that is no longer needed for current operational programs and that is not currently an active waste disposal site.

**Inactive Waste Sites:** Inactive waste sites include units such as burial grounds, unplanned release sites, cribs, ditches, ponds, trenches, and basins, abandoned storage areas, drains, single-shell tank piping, transfer pits, and jumper boxes.

**Interim Closed:** Areas designated as “Interim Closed” are released from the posting requirements when the remedial actions meet the operable unit’s record of decision cleanup requirements.

**Less Than Detectable:** An analytical term for a concentration in a sample that is lower than the minimum detection capabilities of that analytical equipment or process.

**Low-Level Waste:** Any gaseous, liquid, or solid radioactive waste not classified as high-level waste, transuranic waste, or spent nuclear fuel, as defined by DOE Order 435.1, *Radioactive Waste Management*.

**Mean:** Average value of a series of measurements.

**Minimum Detection Limit:** Smallest amount or concentration of a radionuclide or nonradioactive element that can be reliably detected in a sample.

**Near Facility Environmental Monitoring:** The collection and analysis of samples of air, water, soil, biota, and other media near nuclear facilities on DOE sites and their environs and the measurement of external radiation to demonstrate compliance with applicable standards and assess radiation exposures to employees and members of the public, and the near-field environment.

**Nonroutine Activities:** Any actions on a large-scale (>2 hectares [5 acres]), including stabilization, soil removal, fixative or sealant application, other surface treatments, or other activities that could affect future remediation activities in an inactive waste site.

**Not Detected:** A reporting term which describes any or all of the following: the overall analytical error was greater than the radionuclide concentration itself; or, after allowing for the subtraction of the background level of the radionuclide, the resulting concentration was less than zero; or, no radio analytical peak was detected during the analysis.

**Operable Unit:** A discrete area for which an incremental step can be taken toward comprehensively addressing site problems. The cleanup of a site can be divided into a number of operable units, depending on the complexity of the problems associated with the site.

**Point Source:** A single defined point (origin) of an airborne release, such as a vent or stack.

**Pond:** A surface impoundment used to contain or percolate low-level liquid radioactive waste, mixed waste, or hazardous waste.

**Quality Assurance:** A process designed to maintain the quality of the results of a program within established limits of acceptance.

**Radiation Survey:** Evaluation of an area or object with portable instruments to identify radioactive materials and radiation fields present.

**Radioactive Byproduct:** Any radioactive material (except special nuclear material) yielded in or made radioactive by exposure to the radiation incident to the process of producing or using special nuclear material.

**Radiological Control Area:** An area where access is controlled to protect individuals from exposure to radiation and/or radioactive materials. Radiological control areas include, but are not limited to, areas posted as radiation areas, surface contamination, and underground radioactive materials, to describe the radiological condition of the area within.

**Radiological Posting:** Information in the form of signs and barriers to inform people of radiological conditions that warrant avoidance or special precautions for entry.

**Representative Sample:** A sample that can be expected to exhibit the average properties of the sample source.

**Retired Waste Site:** A waste site that is isolated and no longer available to receive waste in any form.

**Routine Activities:** Any actions on a small-scale (<2 hectares [5 acres]), including radioactive hot-spot removal, vegetation removal, fencing, posting, herbicide spraying, stabilization, or immediate spill response) in an inactive waste site. In general, these routine actions shall not interfere with RCRA/CERCLA response or site investigations.

**Sampling System:** Instrumentation and equipment that remove a part of a liquid or airborne waste stream for subsequent quantitative determination of stream parameters. The system generally employs such devices as filters, other sample collection media, or effluent traps of some kind. A continuous sampling system removes a part of the stream continuously except during sample change, maintenance, repair, or other necessary outages. A grab sampling system removes an instantaneous part of the stream or removes a part of the stream over a time period.

**Sediment Column:** The sediment beneath a crib. It can mean either all the sediment beneath the bottom of the crib extending to the water table or all sediment beneath a crib contaminated by radioactive materials.

**Site:** The location of a significant event, a prehistoric or historic occupation or activity, or a building or structure (whether standing, ruined, or vanished) where the location itself maintains historical or archeological value, regardless of the value of any existing structure.

**Soil at depth:** Soil below 91 cm (36 in.).

**Soil Contamination:** Contaminated soil not releasable in accordance with DOE Order 5400.5.

**Solid Waste:** Any discarded material that is not excluded by WAC 173-303-017(2) or that is not excluded by a variance granted under WAC 173-303-017(5). Materials are solid waste if they are: (1) abandoned by being disposed of, burned, or incinerated, or (2) accumulated, stored, or treated (but not recycled) before (or in lieu of) being abandoned by being disposed of, burned, or incinerated. In addition, a solid waste includes any material considered to be inherently waste-like.

**Speck Contamination:** Single grains of soil, rust particles, feces, or pieces of vegetation.

**Spot Contamination:** A spot or quantity of contamination less than 1 cm<sup>3</sup> (0.06 in.) in volume, or areal contamination less than 15 cm<sup>2</sup> (2.3 in.<sup>2</sup>) in area.

**Stabilization:** The process of covering surface contaminated areas with clean backfill or topsoil.

**Standard:** A specified set of rules or conditions concerned with the classification of components; delineation of procedures; definition of terms; designation of materials, performance, design, or operations; or measurements of quality in describing materials, products, systems, services, or practices. A standard is more general than a procedure or specification and more specific than a criterion.

**Standard Deviation:** A measure of the range of values about the mean.

**Standard Error of the Mean:** A measure of the uncertainty in the estimated mean of averaged values.

**Surface Soil:** Soil from 0 cm (0 in.) to 5 cm (2 in.) deep.

**Surplus Facilities:** Surplus facilities include all facilities that have been accepted into a decommissioning program.

**Survey:** A method to detect the release, disposal, or presence of radioactive materials or hazardous substances under a specific set of conditions to determine actual or potential hazards. Such an evaluation may include, but is not limited to, tests, physical examinations, and measurements of radiation or concentrations of materials.

**Suspect Waste Site:** A site, believed to have been previously unknown or undocumented, that, because of characteristics present at the site or historical information about the site, is suspected of containing waste (i.e., non-dangerous, hazardous, dangerous, mixed, and radioactive).

**Tank Farm:** An area of large underground tanks designed to store high-level liquid waste.

**Thermoluminescent Dosimeter:** A chip or series of chips used for measuring external gamma radiation. It consists of a material capable of absorbing energy imparted by ionizing radiation, then emitting light as a result of thermal stimulation. A measure of that light is proportional to the radioactivity absorbed.

**Total Analytical Uncertainty:** All analytical measurements include some degree of uncertainty as a consequence of a series of unavoidable and unintentional inaccuracies related to the collection and analysis of samples. Examples of these inaccuracies can include errors associated with reading and recording results, sample handling and processing, instrument calibrations, numerical rounding, and randomness of radioactive decay. The total analytical uncertainty value implies that approximately 95% of the time a recount or reanalysis of the sample would give a value somewhere in the range between the initial reported value plus or minus the total analytical uncertainty.

**Trip Blank:** A type of field blank used to accompany sample containers to and from the field and to detect contamination or cross-contamination that occurs during sample handling and transportation.

**Uncontaminated Soil:** A soil or a land area that requires no controls or restrictions in any way for radiation protection purposes and/or meets the contamination limit specifications.

**Underground Radioactive Material:** A radiological posting status where subsurface radioactivity is present but where surface contamination does not exceed the soil standards.

**Unity Rule:** If more than one radionuclide is present, the sum of the fractions represented by each radionuclide concentration divided by its respective limiting concentration (administrative control value) shall not exceed unity. This rule could also apply to parameters other than radionuclide concentration.

**Unplanned Release Site:** An area that was contaminated by an unplanned release of radioactive contamination, making it a radiological control area.

**Unrestricted Release:** Values below which unrestricted release of soils will occur will be defined in an applicable record of decision.

**U.S. Environmental Protection Agency:** The federal agency chartered with carrying out and monitoring the environmental regulations.

**Waste Management:** The activity involved with storing, disposing of, shipping, handling, and monitoring all radioactive waste.

**Waste Sites:** Any facility used for the planned disposal of hazardous, radioactive, toxic, or nonradioactive/nontoxic waste.

## 11.0 DATA SUMMARY METHODS

Measuring any physical quantity has some degree of inherent uncertainty. This uncertainty results from the combination of all possible inaccuracies in the measurements process, including such factors as the reading of the result, the calibration of the measuring device, and numerical rounding errors.

In this report, individual radioactive measurements are accompanied by a plus or minus ( $\pm$ ) value, which represents the total propagated analytical uncertainty (or two-sigma counting error). The two-sigma counting error gives information on what the measurement might be if the same sample were counted again under identical conditions. The two-sigma counting error implies that approximately 95% of the time, a recount of the same sample would give a value within plus or minus the two-sigma counting error at the value reported.

Values in the tables that are less than the minimum detectable activity indicate that the reported result might have come from a sample with no radioactivity. Such values are considered below the detection limits of the measuring instrument. Also note that each radioactive measurement must have the random background radioactivity of the measuring instrument subtracted; therefore, negative results are possible, especially when the sample has very little radioactivity.

Reported averages also are accompanied by a plus or minus ( $\pm$ ) value, which represents two standard deviations from the mean. If the data fluctuate randomly, this is a measure of the uncertainty in the estimated average of the data because of this randomness.

Where averages of averages are reported, the plus or minus ( $\pm$ ) value represents two standard errors of the mean.

The mean,  $X$ , is computed as:

$$X = \frac{1}{n} \sum_{i=1}^n X_i$$

where  $X_i$  is the  $i^{\text{th}}$  measurement and  $n$  is the number of measurements.

The standard error of the mean was computed as:

$$SE = \sqrt{\frac{s^2}{n}}$$

where  $S^2$ , the variance of the  $n$  measurements, was computed as:

$$S_M^2 = \frac{1}{n-1} \sum_{i=1}^n (X_i - \bar{X})^2$$

This estimator,  $S^2$ , includes the variance among the samples and the counting variance. The estimated  $S^2$  occasionally may be less than the average counting variance.
